Automation

We replace repetitive manual work with reliable automated workflows, so your team can spend its time on work that actually needs people.

Why clients come to us

Every business has them: the spreadsheet that gets copied between systems, the report someone assembles every Monday, the approval that waits in an inbox. Individually they seem small. Together they cost hours every week and introduce errors nobody notices until later.

Clients come to us with a specific irritation or just a sense that things should be smoother. We look at how the work really happens, find what's worth automating, and build solutions that fit into the tools you already use.

What we do

We take ownership of the full path from understanding a process to running it reliably in production.

Map & identify
We walk through how your processes actually work, find the bottlenecks, and prioritise what to automate first based on time saved, risk reduced, and effort required.

Build workflows
We design and build automations that move data, trigger actions, generate documents, send notifications, and coordinate steps across your systems, from simple connections to multi-step processes with approvals and exceptions.

Integrate your systems
We connect your CRM, ERP, finance tools, databases, email, and internal systems through APIs, so information flows without anyone retyping it. Where a system has no API, we find a practical way around it.

Monitor & maintain
Automations that fail silently are worse than no automation. We build in logging, alerts, and error handling, and stay involved to keep workflows running as your tools and processes change.

Our Approach

- **Automate what's worth automating.** Not every process should be automated. We focus on where the return is clear.

- **Fit the way you work.** We build around your tools and habits instead of asking your team to relearn everything.
- **Handle the exceptions.** Real processes have edge cases. We design for them from the start so the automation doesn't break the first time something unusual happens.
- **Start small, grow steadily.** One well-chosen automation proves the value and builds trust for the next.
- **Keep people in control.** Where a human decision matters, we build the approval step in, with full visibility of what the automation has done.

Technologies We Use

We use the tools that fit the process, from lightweight workflow platforms to custom-built services when the job needs it.

- Python: Scripting and services · Custom automation
- Django: Back end · Internal tools and admin
- REST APIs and webhooks: Integrations · Data exchange
- Workflow platforms: Orchestration · Low-code automation
- PostgreSQL: Database · Data management
- Azure: Cloud hosting · Scheduled and event-driven jobs
- AI models: Document and text processing · Smarter automation

What we automate

- **Data entry and synchronisation:** keeping systems consistent without manual copying
- **Reporting and documents:** invoices, reports, and summaries generated and delivered on schedule
- **Approvals and notifications:** requests routed to the right person with a clear trail
- **Onboarding and customer workflows:** repeatable multi-step processes that run the same way every time
- **AI-assisted tasks:** reading emails, classifying requests, and extracting data from documents
