Business Analysis

We turn business goals into clear requirements and a plan that development can actually deliver.

Why clients come to us

Many software projects don't fail because of the code. They struggle because nobody agreed on what was being built, for whom, and why. Requirements get lost between departments, priorities shift mid-project, and the result doesn't quite match what the business needed.

Clients come to us with an idea that isn't fully defined, a legacy system that needs replacing, or a process they know is broken but can't yet describe in detail. We bring structure, ask the right questions, and make sure everyone is aiming at the same target before significant money is spent.

What we do

We work as a bridge between your business and the technical team, turning needs into something clear, shared, and buildable.

Discovery & stakeholder alignment
We talk to the people who use, run, and pay for the system, to understand goals, pain points, and constraints. We help different voices in your organisation reach a shared view.

Process & requirements analysis
We map how work happens today and define what the solution must do tomorrow: user stories, workflows, rules, and acceptance criteria that are specific enough to build and test against.

Scope & prioritisation
We help you decide what comes first. By separating essentials from nice-to-haves, we define an MVP and a roadmap that fits your budget, timeline, and ambitions.

Delivery support
We stay involved once development starts: answering questions, refining requirements as we learn, validating what's built, and making sure the result solves the original problem.

Our Approach

- **Understand the why.** A requirement is only useful when we know the goal behind it. We dig into the problem, not just the request.
- **Talk to real users.** Assumptions are cheaper to test early than to fix after launch.

- **Make it visible.** Diagrams, prototypes, and clear language keep everyone, technical or not, on the same page.
- **Challenge, constructively.** We question assumptions and explain trade-offs, so decisions are made with open eyes.
- **Stay close to delivery.** Our analysts work with the developers and designers, so nothing is lost in translation.

What you get

- **Clear requirements:** user stories, process maps, and acceptance criteria
- **A prioritised roadmap:** MVP scope and phased delivery plan
- **Reliable estimates:** grounded in defined scope, not guesswork
- **Risk and dependency overview:** integrations, data, compliance, and organisational factors identified early
- **Shared understanding:** one source of truth for stakeholders, designers, and developers

Methods We Use

We adapt our methods to the size and style of the project, from a short workshop to a full discovery phase.

- Stakeholder interviews and workshops: Discovery · Alignment
- User stories and acceptance criteria: Requirements · Testability
- Process and system mapping: Analysis · Current and future state
- Prototypes and wireframes: Validation · Early feedback
- Backlog and roadmap planning: Prioritisation · Delivery planning

Where it made the difference

[Project name] [placeholder]
[One or two sentences on the starting situation, what discovery uncovered, and how it shaped the product, e.g. a reduced scope, a changed priority, or a problem solved before build began.]
