Why clients come to us

Most clients don't arrive with a finished specification. They show up with a rough prototype, a handful of screenshots, or just an idea of what the product should feel like. Some have an existing app that's grown clunky and needs a rethink.

Wherever the starting point is, the design team picks up from there instead of asking clients to arrive design-ready.

What we do

We turn ideas into clear, usable digital products through a structured design process from understanding problem to creating and delivering final experience.

Discovery

We understand your users, business goals, and challenges to define the right problem to solve.

AI Prototyping

We turn ideas into AI-powered prototypes that are easy to validate.

High-fidelity Design

We refine validated concepts into polished, scalable interfaces with a strong focus on usability.

Implementation

We work with development to bring the solution to life and ensure a polished final product.

Our Approach

- Flexes to what the client already has. No two engagements start from the same place, so the process doesn't force one.
- If the client has a strong direction, the team works from that foundation and sharpens it, rather than overriding it.
- Client has only a problem to solve? The team leads the design from a blank page, building structure and direction from scratch.
- Sometimes, it’s genuinely shared with clients co-creating parts of the interface alongside Avinto’s designers.

Scandinavian design, applied to software

Most people picture whitespace and pale wood. Scandinavian design is really a functional philosophy: form follows function, nothing without purpose. That's the standard we design to.

Function before flourish
Every screen is built to do its job clearly first. Visual polish comes after usability, not instead of it.

Restraint as a design choice, not a limitation
Removing unnecessary elements isn't about minimalism for its own sake. It's about making sure nothing gets in the way of what the user actually needs to do.

Accessibility built in, not bolted on
Scandinavian design has long prioritized designing for everyone, not just the average user, a principle that shapes how interfaces are built from the start rather than patched later.

Honesty in interaction.
Interfaces behave the way they look like they'll behave no hidden gestures, no decorative elements pretending to be functional ones.

How AI shapes our design process

AI plays a specific, deliberate role in our design process not a shortcut, but a tool used at the right stage.

- Faster first drafts
- Validation before build
- Prototypes, built in real time
- Human direction, AI execution

Faster first drafts

Instead of starting from a blank canvas, AI helps generate initial design directions the team can react to and refine, turning the first hours of a project into a meaningful starting point rather than a blank page. It gives designers something concrete so more time can be spent improving the right direction.
