DevOps

We build the pipelines, infrastructure, and monitoring that let teams ship software quickly, safely, and often.

CTA: Contact us

Why clients come to us

Releasing software shouldn't be stressful. But for many teams it still means manual deployments, environments that don't match, and the quiet fear that a change will break something on a Friday afternoon.

Clients come to us with a product that's growing faster than its infrastructure, a cloud bill that keeps climbing, or a release process that depends on one person who knows how it works. We make delivery predictable, so your team can focus on building the product.

What we do

From the first commit to a production system running in the cloud, we take ownership of the engineering practices and infrastructure that keep software reliable.

Assess & plan
We review how you build, release, and run software today, and identify where the biggest gains in speed, stability, security, and cost are.

CI/CD pipelines
We set up automated build, test, and deployment pipelines so every change is verified and released consistently, whether you deploy once a month or ten times a day.

Cloud infrastructure
We design and manage cloud environments that are secure, scalable, and cost-aware, using infrastructure as code so everything is repeatable, documented, and easy to rebuild.

Monitor & operate
We build in logging, metrics, and alerting so issues are caught early, not reported by users. We can stay involved to run the platform, respond to incidents, and keep improving it.

Our Approach

- **Automate the repeatable.** If it's done by hand more than twice, it should be a pipeline.
- **Everything as code.** Infrastructure and configuration live in version control, so environments are consistent and changes are traceable.

- **Security from the start.** Secrets management, access control, and dependency scanning are part of the pipeline, not an afterthought.
- **Make it observable.** You can't fix what you can't see. We make the health of the system visible to the whole team.
- **Share the knowledge.** We document and hand over what we build, so your team isn't dependent on us.

Technologies We Use

We choose tools to fit your platform and team, and work with the cloud and tooling you already have where it makes sense.

- Azure: Cloud hosting · Scalability
- Docker: Containers · Consistent environments
- CI/CD pipelines: Build and deploy · Automated releases
- Infrastructure as code: Provisioning · Repeatable environments
- PostgreSQL: Database · Backups and operations
- Monitoring and logging: Observability · Alerts and diagnostics

Built for reliable delivery

Faster releases. Automated pipelines shorten the path from finished code to live product.

Fewer surprises. Consistent environments and automated testing catch problems before users do.

Secure by default. Access controls, encryption, and compliance requirements, including GDPR, are built into how the platform is run.

Cost under control. Right-sized infrastructure and clear usage visibility keep cloud costs in check as you grow.

Platforms we run

BCI Drivers and Bring Cargo Driver
Driver apps for international and domestic cargo deliveries, running on Django and PostgreSQL with Azure hosting the platform.

Hugo People
An AI-powered recruitment platform running on Azure, with Next.js, Django, and PostgreSQL.
