Web Development

We build reliable web products, from early ideas and MVPs to complex platforms, integrations, and long-term product development.

Contact us

Why clients come to us

The web is often where your customers, employees, partners, and systems meet. It needs to do more than look good — it needs to work reliably, connect with the rest of your business, and keep up as your needs change.

We work alongside our clients to understand what they are trying to achieve and make the technical decisions that support it. Whether you need a high-performing website, a customer-facing platform, or a custom web application, we build solutions that are secure, scalable, and designed to evolve.

We can help shape the idea, design the architecture, build the platform, connect it to the systems around it, launch it, and continue developing it as your business grows.

What we do

From the first idea to a fully connected platform running in the cloud, we take ownership of the technical work needed to build, launch, and operate your web solution.

Consult & architect

We turn business needs into a clear technical direction. Together, we define the scope, evaluate the options, choose the right technologies, and design an architecture that works for your product today while giving it room to grow.

Develop

We build websites, web applications, SaaS platforms, and customer portals that are fast, responsive, and secure. From the interface users interact with to the backend logic, APIs, and data behind it, we build the complete solution and make sure it works across devices and use cases.

Integrate

Most web platforms need to work with more than just their own code. We connect your platform to APIs, databases, authentication services, payment gateways, AI tools, and third-party systems, making sure information moves reliably between the different parts of your business.

Test, deploy & operate

We build reliability into the development process from the start. Automated testing, CI/CD pipelines, and cloud infrastructure help us release changes safely and consistently. After launch, we can stay involved to monitor performance, maintain the platform, and continue improving it as your needs change.

Built for the modern web

Every platform we build is designed to be reliable today and ready to evolve tomorrow — with the performance, scalability, security, and flexibility needed to support a growing business.

Modern technology

We choose technologies that fit the product rather than following a fixed stack. Modern frameworks, cloud infrastructure, and AI-powered development tools help us build platforms that are efficient to develop, easy to maintain, and ready to evolve.

Scalable by design

A platform should not need to be rebuilt every time the business grows. We design the architecture, infrastructure, and data layer to handle increasing users, traffic, and functionality, whether you're serving a hundred users or a hundred thousand.

Seamlessly connected

Your web platform rarely exists on its own. We connect it to the systems, services, and data your business already relies on, creating a single experience for customers, teams, and partners while keeping information flowing between the different parts of your operation.

Secure & Compliant

Security is part of the platform from the beginning. We use secure authentication, encrypted data, access controls, and appropriate infrastructure to protect your users and keep your platform reliable. We also build with GDPR and relevant industry standards in mind, helping your platform meet the compliance requirements your business depends on.

Technologies We Use

We choose technology based on what the platform needs — its users, integrations, complexity, and how it is expected to grow. Django, React, and .NET are among the technologies we use regularly, supported by reliable databases, well-structured APIs, and scalable cloud infrastructure.

- **Django** — Back end · Python
- **React** — Front end · Web apps
- **.NET** — Back end · Enterprise systems
- **PostgreSQL** — Database · Data management
- **REST APIs** — Integrations · Data exchange
- **Azure** — Cloud hosting · Scalability

Platforms we've built

Real platforms, used every day by the businesses and people they were built for.

Hugo People
An AI-powered recruitment platform that streamlines candidate screening and reference checks through adaptive chat conversations, giving hiring teams objective evaluation reports to review. Built with Next.js, Django, and PostgreSQL on Azure, with AI from OpenAI and Anthropic.

Changeride
A platform that makes buying an electric vehicle simpler by connecting buyers directly with dealerships. Working as a dedicated part of their team, we continuously develop and improve the platform as the business grows. Powered by TypeScript, Preact, and Supabase.

Jambo Bookings
A booking platform that gives African hotels a direct way to manage their rates and reservations while working seamlessly with travel agencies. It keeps pricing fair, commissions strong, and the booking process simple for everyone involved. Developed with Next.js and TypeScript, with MongoDB managing the data.

Jambo Safari Planner
An AI-powered planning tool that creates personalised safari itineraries in seconds. Travellers get a tailored trip plan instantly, and the team behind it saves hours once spent on back-and-forth emails. The platform combines a React front end with Django and FastAPI on the backend.

PitchQuest
A browser-based ear-training RPG that turns music practice into an adventure, with a persistent overworld and a suite of games including a platformer, a rhythm runner, and a harmony shooter. A shared Web Audio core listens to players through their microphone in real time, recognising individual notes, full chords, and rhythms as they play. Built in TypeScript with Phaser 3 and native Web Components.

Hicey
A premium music streaming service built for audiophiles who listen to full albums and care about sound quality. Listeners get an album-focused experience with high-quality playback in the browser, with accounts and payments connected across web and mobile. The platform pairs a React front end with a Python backend.
