AI & Data

We build AI-powered products and data foundations that solve real business problems, from first experiments to production systems.

Why clients come to us

Most teams don't need "AI" in the abstract. They have a slow process, a pile of unstructured data, or a product idea that would be far better if it could understand, predict, or respond. The hard part is knowing which problems AI should solve, and which it shouldn't.

We work alongside our clients to find where AI creates real value, prove it quickly, and then build it properly: connected to your data, your systems, and your users. We can help shape the idea, build the solution, put it into production, and keep improving it as the technology moves.

What we do

From the first experiment to a reliable production system, we take ownership of the work needed to make AI useful in practice.

Explore & validate
We identify where AI and data can make a measurable difference, then test the idea with a working prototype before significant investment is made. You see real results early, and we're honest when an idea isn't ready.

Build AI features
We design and build AI-powered products and features: conversational interfaces, document understanding, recommendations, search, classification, and personalised experiences. We work with leading models from providers such as OpenAI and Anthropic and choose the right one for the task, not the most fashionable one.

Data & integration
AI is only as good as the data behind it. We build the pipelines, databases, and APIs that bring your data together, clean it, and keep it flowing reliably into the systems that depend on it.

Deploy & improve
We take AI from prototype to production with monitoring, evaluation, and cost control built in. After launch, we measure quality, refine prompts and models, and adapt as your data and needs change.

Our Approach

- **Start with your goals.** We take the time to understand your challenges, objectives, and requirements before identifying the right approach and technology.
- **Prove it early.** Quick prototypes let you and your users react to something real before committing to a full build.
- **Evaluate, don't assume.** We test AI output against real examples and measure quality, so decisions are based on evidence.
- **Keep humans in the loop.** AI accelerates the work; people stay in control of decisions that matter.
- **Build for what comes next.** Models change quickly. We design systems so you can swap or upgrade them without starting over.

Technologies We Use

We choose technology based on the problem, the data, and how the solution is expected to grow. Python, Django, and FastAPI are central to much of our AI work, alongside the leading AI model providers.

- OpenAI and Anthropic: AI models · Language and reasoning
- Python: Core language · AI and data processing
- Django and FastAPI: Back end · APIs and services
- PostgreSQL: Database · Structured data
- Vector search: Retrieval · Search over your own content
- Azure: Cloud hosting · Scalability

Responsible AI

AI in a business context needs trust as much as capability.

Your data stays yours. We design with data protection and GDPR in mind from the start, and are clear about what data goes where.

Transparent by design. Users should understand when they're interacting with AI and why it produced a result.

Reliable under real conditions. We plan for edge cases, wrong answers, and fallbacks, not just the happy path.

Cost-aware. We design for sensible usage costs, so a successful feature doesn't become an unpleasant surprise on the invoice.

What we've built

Hugo People

An AI-powered recruitment platform that streamlines candidate screening and reference checks through adaptive chat conversations, giving hiring teams objective evaluation reports to review. Built with Next.js, Django, and PostgreSQL on Azure, with AI from OpenAI and Anthropic.

Jambo Safari Planner

An AI-powered planning tool that creates personalised safari itineraries in seconds. Travellers get a tailored plan instantly, and the team behind it saves hours once spent on back-and-forth emails. Built with a React front end, with Django and FastAPI on the backend.

GOOD TO GO
