# Maintenance

We keep your software secure, up to date, and improving long after launch.

**CTA: Contact us**

## Why clients come to us

Launch is not the finish line. Software depends on frameworks, libraries, cloud services, and app stores that keep changing. Without care, a product that worked perfectly last year becomes slower, less secure, and harder to change.

Clients come to us when the original team has moved on, when they've launched and need a reliable partner for what comes next, or when they want to stop worrying about whether things are being looked after. We take responsibility for the product's health and keep it moving forward.

## What we do

We provide ongoing technical ownership, from keeping things running to developing the product further.

**Monitor & support**
We watch the health of your product and respond when something goes wrong. Issues are investigated, fixed, and explained clearly, with agreed response times.

**Update & secure**
We keep frameworks, dependencies, operating systems, and infrastructure current, and apply security patches promptly. For mobile apps, this includes keeping up with iOS and Android releases and store requirements.

**Improve & optimise**
We tune performance, reduce technical debt, and improve what's already there, so the product stays fast and easy to work on as it grows.

**Develop further**
When your needs evolve, we can add features, integrate new systems, and continue development with a team that already knows your product.

## Our Approach

- **Take ownership.** We treat your product as if it were our own, not as a queue of tickets.
- **Prevent, don't just fix.** Regular updates and monitoring prevent most emergencies before they happen.

- **Be transparent.** You'll know what we've done, what we've found, and what we recommend, in plain language.
- **Plan for change.** We keep the codebase healthy, so adding the next feature stays affordable.
- **Flex to your needs.** From a light safety net to a dedicated team, support fits how much you need.

## What's included

**Reliability.** Monitoring, backups, and incident response keep the product available.

**Security.** Patching and dependency updates reduce exposure to known vulnerabilities.

**Compatibility.** Updates for new browsers, operating systems, and store requirements keep your product working for users.

**Continuity.** Documented systems and a team that knows your product, so you're never dependent on one person.

**Growth.** A pool of development time for improvements and new features as your priorities shift.

## Technologies and Practices

We maintain what we build and what others have built, working with your existing stack rather than insisting on a rewrite.

- Django, React, .NET: Web back end and front end · Platform maintenance
- React Native, Expo, Flutter, Swift, Kotlin: Mobile · Store releases and OS updates
- PostgreSQL: Database · Performance and backups
- Azure: Cloud hosting · Infrastructure upkeep
- Automated testing and CI/CD: Quality · Safe, regular releases
- Monitoring and alerting: Observability · Early detection

## Products we look after

**Changeride**
Working as a dedicated part of the team, we continuously develop and improve the platform as the business grows. Powered by TypeScript, Preact, and Supabase.
